EFFICACY DATA – IN-VITRO

Acne is a common skin condition caused by inflammation of the sebaceous glands that produce sebum/oil. Excess synthesis of sebum or oil acts as a catalyst for the series of events that result in acne. Inhibition of sebum synthesis suggests sebostatic and hence anti-acne potential.

Efficacy Claims -

- Anti-acne
- Prevents oily skin, clogged pores, and acne

Results obtained in vitro. Data demonstrates % Sebum levels compared to Linoleic Acid (LA) and Arachidonic Acid (AA) stimulated group normalised to 100%.

Results

- Anti-Acne Face Pack inhibits the synthesis of sebum in human sebocytes by a maximum of 32% as compared to LA+AA stimulated group.

These results substantiate the anti-acne properties of Anti-Acne Face Pack.
